

Baltimore Skywarn Console — Quick Guide

FOR BALTIMORE REGION SKYWARN NET CONTROLLERS

This replaces your paper log or Excel check-in sheet with a live check-in and reporting tool you run in your browser during a net. It works on a phone, tablet, or laptop — nothing to install, no login required. Bookmark the link below; the same link always opens the current version.

OPEN THE CONSOLE

<https://claude.ai/artifact/NAHsZiy4j9m5u9zy4yuC8W>

1 DURING YOUR NET

- a Fill in the header once, at the start**
Event/activation name, date, operational period, your callsign as Net Control, and which repeater(s) you're running the net on.
- b Log each check-in or report as it comes in**
Time, callsign (type it — if the operator is on the roster, their name and county fill in automatically), county, report type, and a short remark. Hit "+ Add."
- c For hail, wind gust, or flooding, a size/speed/depth field appears**
Hail asks for a size compared to coins/balls; wind gust asks for a speed range; flooding asks minor (under 6") or major (6"+ / impassable). It gets folded into the report automatically.
- d Watch for the red criteria flag**
Selecting a report type that meets NWS reporting criteria (tornado, hail, 50mph+ wind, flooding, etc.) triggers a warning with the NWS relay number — call it in, then mark the entry "Relayed: Yes."

⚠ **Red = meets NWS criteria, relay directly to 800-253-7091. Everything else is background traffic for your own log.**

2 AT THE END OF YOUR ACTIVATION

1

Export your log

Click "Save as CSV" to download a file, or "Copy log" to copy it for pasting straight into Excel.

2

Send it to Chris

Email the CSV (or pasted sheet) to ak3b@outlook.com, subject line **Skywarn Report Log - [Your County]** (e.g. *Skywarn Report Log - Baltimore County*).

3

Clear it for next time

Once sent, click "New net" to reset the log. Your data stays on your own device until you export it — nobody else can see it.

GOOD TO KNOW

Everyone shares the same link and the same tool, but each person's log entries stay private to their own browser — nothing syncs automatically. That's why the export-and-email step at the end matters.
